# TABLE OF CONTENTS

# I. Project Introduction & Product Concept

## 1. Project Name & Overview

**Project Name: EventGo Proof** – A Website for Event Acceptance Management and Booth Compliance Control

**Project Description:**

EventGo Proof is a **B2B SaaS platform** designed to support agencies and event organizers in managing the acceptance and verification of activation campaigns and booths across multiple locations. The platform digitizes the entire process, from setting acceptance criteria and assigning staff/supervisors to collecting Before & After Event photo evidence, reviewing submissions, and automatically generating reports.

Instead of managing all aspects of event operations, EventGo Proof focuses specifically on optimizing multi-location acceptance and verification processes. It helps organizations ensure data transparency, shorten reconciliation time, and minimize the risk of missing or insufficient evidence when working with partners.

## 2. Market Problem & Pain Points

In Activation and Booth campaigns, especially those implemented simultaneously across multiple cities and locations, event organizers and agencies have to manage a large amount of fieldwork. Each booth must not only be set up according to the approved design but also meet various requirements, such as location, dimensions, brand identity, display materials, POSM, staffing, and the overall condition before and after the event. Therefore, **acceptance and evidence collection** play an important role in proving that each component has been implemented according to the agreed requirements.

However, in practice, this process is often managed through a combination of different tools such as **Zalo for communication, Excel for progress tracking, Google Drive for storing photos, and separate files for compiling reports**. Each tool handles only one part of the process, without providing an integrated workflow. As the number of booths increases, managers have to constantly check multiple group chats, folders, and spreadsheets to determine the status of each location. This significantly increases management time and creates a high risk of scattered or lost information.

Another major issue is the **lack of standardized acceptance evidence**. For example, a campaign may require supervisors to provide wide-angle photos of the booth, close-up photos of the logo, POSM, products, or before-and-after photos. Without a system that clearly defines each criterion and the required evidence, different supervisors may submit photos in different formats and levels of detail. Some locations may provide complete evidence, while others may miss important photos or submit images that do not clearly demonstrate compliance. Managers then have to repeatedly request additional evidence, which delays the acceptance process.

**Progress tracking is another significant pain point.** When there are only a few locations, tracking through Excel may still be manageable. However, when an activation campaign involves dozens or hundreds of booths, manual updates become increasingly complicated. Managers may struggle to quickly identify which locations have completed the work, which have not submitted evidence, which are waiting for approval, and which have failed to meet the requirements. Without a centralized dashboard, it is also difficult to identify problems early and take timely action.

In addition, a manual acceptance process creates **risks during reconciliation between different parties**. Agencies need to demonstrate to clients that all campaign components have been implemented as agreed, while vendors and field teams also need evidence to confirm that their work has been completed. If photos are missing, timestamps or location information are unclear, or there is insufficient evidence to verify a specific requirement, the acceptance and payment process may be delayed. In some cases, a lack of clear and reliable data can even lead to disagreements between agencies, clients, and vendors.

**Core Problem:** Agencies and event organizers face difficulties in managing multi-location activation and booth acceptance because the current process is fragmented, manual, and lacks a centralized evidence management system. This leads to wasted time, missing or inconsistent evidence, limited progress visibility, and increased risks during reconciliation with clients and partners.

3. Project Idea

The idea for EventGo Proof was developed in response to the growing demand for multi-location activation campaigns and booth deployments. As event campaigns are increasingly implemented across multiple cities and venues, agencies and event organizers are required to coordinate a large number of booths, supervisors, and field teams simultaneously. However, the acceptance

and verification process remains largely manual and lacks a specialized system for managing evidence and ensuring compliance with predefined requirements.

Currently, teams often rely on multiple disconnected tools, such as Zalo for communication, Excel for progress tracking, and Google Drive for storing photos and documents. Although these tools are useful for individual tasks, they do not provide an integrated workflow for the entire acceptance process. As a result, information can become fragmented, evidence may be incomplete or difficult to retrieve, and managers must spend considerable time following up with field teams and consolidating reports.

Therefore, EventGo Proof was proposed to address this specific operational gap. Rather than attempting to manage the entire event organization process, the platform focuses on multi-location acceptance, evidence management, and verification. By centralizing these activities, EventGo Proof aims to make the acceptance process more standardized, transparent, and efficient.

4. Proposed Solution

**EventGo Proof** is a **B2B SaaS platform** designed to digitalize and streamline the acceptance and verification process for activation campaigns and booth deployments. The platform provides an integrated workflow that enables agencies and event organizers to set acceptance criteria, assign supervisors, collect evidence, review submissions, track progress, and generate reports within a single system.

The proposed solution includes the following key functions:

**Centralized Campaign Management.**

Event organizers can create and manage multiple campaigns and locations within a single platform. Campaign information, booth details, assigned supervisors, deadlines, and acceptance status are centralized for easier management and monitoring.

**Standardized Acceptance Checklists.**

Managers can establish specific acceptance criteria for each campaign or booth, including booth setup, brand identity, POSM, product displays, staffing, and other campaign requirements. This ensures consistency in the evaluation process across different locations.

**Digital Evidence Collection.**

Supervisors can upload Before & After Event photos and other required evidence directly to the

platform. Each submission is associated with a specific campaign, location, booth, and acceptance criterion, making evidence easier to organize and verify.

**Real-Time Progress Tracking.**

A centralized dashboard enables managers to monitor the status of each location, including completed, pending, under-review, and failed submissions. This provides a comprehensive overview of campaign progress without requiring managers to check multiple spreadsheets or communication channels.

**Evidence Review and Approval.**

Authorized reviewers can evaluate submitted evidence against predefined acceptance criteria. If the evidence is incomplete or does not meet the requirements, reviewers can request revisions or additional submissions before approval.

**Automated Reporting.**

Once the acceptance process is completed, the platform can consolidate campaign data and evidence into structured reports. This reduces manual reporting tasks and supports a more transparent reconciliation process between agencies, clients, and partners.

5. Product Benefits

For **agencies and event organizers**, EventGo Proof reduces the time and effort required for manual tracking, follow-ups, evidence verification, and report preparation.

For **supervisors and field teams**, the platform provides clear acceptance criteria and a structured submission process, reducing confusion and ensuring that all required evidence is properly collected.

For **clients and partners**, EventGo Proof provides a centralized and transparent source of evidence, making it easier to verify whether campaign requirements have been fulfilled.

# II. Project Evaluation

### 1. Innovation

EventGo Proof focuses on solving a specific task in multi-location activation campaigns: verifying and reconciling implementation at each location.

There are already comprehensive event management platforms in the market, such as Cvent, which provide a wide range of functions, from event registration and attendee management to exhibitor/booth management, check-in, and reporting. EventGo Proof does not aim to replace

these comprehensive event management systems. Instead, it focuses on a more specific problem: checking and confirming whether the actual implementation meets the agreed requirements.

| Criteria | Cvent | EventGo Proof |
|---|---|---|
| **Product scope** | Comprehensive event management platform | Focuses on verification and reconciliation for multi-location activations |
| **Registration & booth management** | Supports exhibitor, booth, and registration information management | Manages essential information for implementation locations within a campaign |
| **Pre-event preparation** | Manages registration, exhibitors, and related activities | Prepares location lists, checklists, assigned personnel, and verification requirements |
| **On-site inspection** | Provides functions for managing activities and tasks within the system | Supervisors directly inspect each location based on checklists and submit evidence |
| **Implementation requirement verification** | Manages exhibitor/sponsor information and related content | Converts each implementation requirement into a specific inspection item |
| **Verification evidence** | Manages event data, documents, and content | Photos and notes are directly linked to each item requiring verification |
| **Handling failed items** | Manages tasks and related information | Approvers can approve or request revisions, with reasons and submission history recorded |

| | | |
|---|---|---|
| **Verification tracking** | Tracks event data and activities at a broader level | Tracks missing items, unapproved items, assigned personnel, and processing history |
| **Final campaign report** | Provides event reports and data analytics | Consolidates evidence and approval history into verification records for each location |
| **Core focus** | Managing the entire event lifecycle | Solving the question: "Has the implementation requirement been correctly carried out on-site?" |

The key difference of EventGo Proof does not lie in creating completely new functions, but in focusing and combining familiar functions into a specific verification workflow. Instead of having information scattered across Zalo, Excel, Google Drive, and photo folders, EventGo Proof organizes the process into one unified flow:

**Implementation Requirements → Checklist → On-site Inspection → Evidence Submission → Approval/Revision Request → Resubmission → Tracking → Report Generation**

For example, an agency may run an activation campaign for a brand involving 12 booths over 3 weekends. Each booth may have requirements such as: the logo must be placed correctly, standees must be available, the product display area must be set up, the required number of samples must be available, and activities must operate according to the agreed schedule.

Under the traditional process, supervisors may take photos and send them to multiple group chats. The Project Manager then has to find the photos, identify which booth each photo belongs to, compare them with the requirements, and consolidate the information into a report. When an item does not meet the requirements, finding the relevant photo and tracking the revision process creates additional work.

With EventGo Proof, each requirement is converted into a specific checklist item. The Supervisor checks each item at the assigned location and submits photos or notes as evidence. The Approver can approve the item or request a revision, with the reason for revision recorded together with the processing history. The Project Manager can monitor missing or unapproved items and generate a report once the campaign is completed.

## 2. Feasibility

### 2.1. Technical Feasibility

The EventGo Proof MVP primarily uses common technologies such as a web application, cloud database, image storage, and role-based access control. The product can initially be developed as a mobile-friendly web application rather than requiring users to download an app. This helps reduce barriers to adoption among Supervisors and temporary event staff.

The core functions include:

- Creating and managing campaigns.
- Importing location lists from Excel/CSV.
- Creating checklists.
- Assigning responsible personnel.
- Taking and submitting photos and notes.
- Approving or requesting revisions.
- Storing submission history.
- Tracking the status of each checklist item.
- Generating reports.

An important technical requirement is the ability to operate in on-site conditions. When the network is weak or unavailable, data should be temporarily stored and clearly displayed as "Not yet submitted," then submitted once the connection is restored. The team should also test cases such as large image files, repeated submissions, simultaneous approvals by two users, access revocation, and shared links.

### 2.2. Operational Feasibility

EventGo Proof does not require all personnel involved in an event to use the system. The MVP focuses on three main user groups:

| Role | Responsibilities on EventGo Proof |
|---|---|
| **Project Manager** | Creates campaigns, enters locations, creates checklists, assigns personnel, tracks progress, and generates reports |

| | |
|---|---|
| **Site Supervisor** | Inspects the assigned location, completes the checklist, and submits photos/notes |
| **Approver** | Reviews evidence, approves or requests revisions, and tracks processing history |

When necessary, clients/partners can be granted permission to view or approve specific data within an authorized scope. This structure helps reduce implementation barriers because users only need to perform tasks directly related to their responsibilities.

In the initial stage, EventGo Proof can be tested on a small scale, with approximately 10–20 locations per campaign. The purpose of this stage is not only to check whether the system works technically, but also to observe whether users actually use EventGo Proof in their work or return to Zalo, Excel, and photo folders as they did before.

### 2.3. Market and Willingness-to-Pay Feasibility

The initial target customers of EventGo Proof are agencies that frequently conduct activation campaigns across multiple locations and need to consolidate evidence and reconcile results for client reporting.

**Buyers**

Potential purchasing decision-makers include:

- Agency owners.
- Operations Heads.
- Managers who have decision-making authority or control project budgets.

**Users**

- Project Managers.
- Site Supervisors.
- Approvers or personnel responsible for verification.

**Initial Pricing Hypothesis**

EventGo Proof could initially test a price of approximately VND 1–3 million per campaign, depending on the number of locations, usage period, storage capacity, and level of support. This is only a pricing hypothesis, not a market-validated price.

To validate customers' willingness to pay, the team needs to interview target customers and investigate:

- The number of locations in a typical campaign.
- How much time an agency currently spends on documentation consolidation and reconciliation.
- The personnel costs associated with this work.
- Common problems when using Zalo/Excel/Drive.
- Whether customers are willing to pay for a tool that solves this problem.
- What price level is appropriate for different campaign sizes.

Customers actually using and paying for the product provides stronger validation than simply evaluating whether the idea is "useful" or "easy to use."

**2.4. Financial Feasibility**

The economic value of EventGo Proof can be evaluated based on the time and resources saved during the consolidation and reconciliation of verification documentation.

The figures used at this stage are only illustrative examples of the calculation method, not actual market data. During customer testing, the team needs to replace these assumptions with actual data on processing time, personnel costs, storage costs, training, support, and other direct costs.

**2.5. Product Testing Plan**

To validate feasibility, EventGo Proof can be tested through a **6–8 week pilot**.

| Stage | Activities |
|---|---|
| **Weeks 1–2** | Interview approximately 15–20 buyers and operational users to identify current workflows, problems, and actual needs |
| **Week 3** | Finalize the prototype/MVP and conduct testing with approximately 3 agencies |
| **Weeks 4–6** | Deploy the product in real campaigns and track usage, errors, and support requirements |

| | |
|---|---|
| **Weeks 7–8** | Compare results before and after implementation, evaluate effectiveness, and assess the likelihood of repurchase |

Initial validation criteria include:

- At least 2 out of 3 pilot agencies accept and pay for the product.
- A target of reducing documentation/reconciliation processing time by at least 30%.
- At least 1 customer makes a repeat purchase after the first campaign.
- A target of having at least 90% of required items processed through the EventGo Proof workflow without the development team entering data on behalf of users.
- The product generates a positive contribution margin after direct costs are taken into account.

These thresholds are testing criteria proposed by the team, not industry-wide standards.

Limiting the initial functions allows the team to focus its resources on one clearly testable problem: verifying and reconciling the implementation of multi-location activation campaigns.

**3. Big Impact**

**4. Market Size (TAM–SAM–SOM)**

**4.1. Market Overview**

**4.1.1. Market Context**

EventGo Proof operates within the Event Management Software market. However, rather than managing the entire event lifecycle, the product addresses a more specific operational need: controlling and verifying the deployment of booths and activations across multiple locations.

The global Event Management Software market is experiencing continued digitalization as event organizers increasingly adopt software solutions to manage event-related activities. According to IMARC Group, the global Event Management Software market was valued at USD 7.2 billion in 2025 and is projected to reach USD 14.7 billion by 2034, representing a CAGR of 7.90% during 2026–2034. The market includes solutions for event planning, venue management, registration, marketing, exhibition management, and other activities across the event lifecycle.

In Vietnam, the Event Management Software market was valued at USD 28.57 million in 2025 and is projected to reach USD 55.88 million by 2034, with a CAGR of 7.74% during 2026–2034. However, this figure covers various product categories, including ticketing, event registration,

venue management, event marketing, and event planning. Therefore, the overall market value should not be interpreted as the direct market size of EventGo Proof.

#### 4.1.2. EventGo Proof's Target Market

EventGo Proof targets the **B2B market**, focusing on organizations that frequently organize or implement events involving multiple booths, display points, or activation locations.

**Target customers include:**

- Event organizing committees;
- Event organizing agencies;
- Activation agencies;
- Program management units responsible for multiple booths or locations.

Among these segments, event organizing committees represent EventGo Proof's primary customer group. EventGo Proof is particularly suited to programs that involve:

- Multiple booths or display points;
- Specific implementation requirements for each booth;
- Multiple on-site personnel or supervisors;
- The need to collect photographic evidence of implementation;
- A review process and revision requests;
- The need to compile final acceptance documents and reports after the program.

### 4.2. TAM – TOTAL ADDRESSABLE MARKET

#### 4.2.1. Definition of TAM

**TAM (Total Addressable Market)** represents the total potential market for a product or service if geographical, sales, and operational constraints are not taken into account. For EventGo Proof, TAM is defined with reference to the global Event Management Software market, as this represents the broader market within which the product could potentially expand in the long term.

#### 4.2.2. TAM Size

According to IMARC Group, the global Event Management Software market was valued at USD 7.2 billion in 2025 and is projected to reach USD 14.7 billion by 2034, with a CAGR of 7.90% during 2026–2034. The market encompasses a wide range of solutions, including event planning,

venue management, ticketing, event registration, event marketing, exhibition management, and other platforms supporting event operations.

#### 4.2.3. Significance of TAM for EventGo Proof

The USD 7.2 billion figure is used as a TAM reference point rather than as revenue that EventGo Proof can directly capture. This distinction is important because EventGo Proof addresses only a specific segment of the broader Event Management Software market, focusing on:

**Control → Evidence Collection → Acceptance → Verification → Reporting**

Therefore, EventGo Proof follows a niche-first market entry strategy, addressing a specific operational problem before expanding into broader event management functions.

### 4.3. SAM – SERVICEABLE AVAILABLE MARKET

#### 4.3.1. Definition of SAM

**SAM (Serviceable Available Market)** refers to the portion of the TAM that a business can serve based on its product offering, target customer segments, and operating geography. In its initial market-entry phase, EventGo Proof focuses on the Vietnamese market.

#### 4.3.2. Event Management Software Market in Vietnam

According to IMARC Group, the Vietnam Event Management Software market was valued at USD 28.57 million in 2025 and is projected to reach USD 55.88 million by 2034, with a CAGR of 7.74% during 2026–2034. However, this market includes multiple solution categories, whereas EventGo Proof focuses specifically on booth and activation implementation control, evidence collection, review, and acceptance. Therefore, the USD 28.57 million figure is used as a reference market size rather than EventGo Proof's actual SAM.

#### 4.3.3. EventGo Proof's SAM Scope

EventGo Proof narrows its serviceable market to organizations that have a specific need for multi-location implementation monitoring, evidence collection, and acceptance.

| Criteria | SAM Target Segment |
|---|---|
| Customer type | Event organizing committees, event agencies, activation agencies |
| Geographic scope | Vietnam |

| | |
|---|---|
| Program type | Events, exhibitions, activations, roadshows, and booth-based campaigns |
| Operational scale | Multiple booths or locations |
| Core need | Verifying implementation against predefined requirements |
| Evidence | Before/after photographs and implementation evidence |
| Process | Checklist → Evidence → Review → Revision → Approval |
| Output | Acceptance documents and implementation reports |

Therefore, EventGo Proof's practical SAM is significantly narrower than the overall Event Management Software market, but it is more closely aligned with the product's capabilities and target customer needs.

#### 4.3.4. SAM Calculation Method

Due to the lack of sufficiently detailed public data on the number of organizations in Vietnam that specifically require multi-location booths or activation acceptance services, EventGo Proof does not use an assumed customer count to calculate its SAM.

Instead, the team applies a bottom-up market sizing approach:

**SAM = Target Organizations × Relevant Campaigns per Year × Average Fee per Campaign**

Where:

- **Target organizations:** Event organizing committees, event agencies, and activation agencies that manage booth deployment or multi-location activation campaigns;
- **Relevant campaigns per year:** The number of campaigns conducted by these organizations that require implementation verification and acceptance;
- **Average fee per campaign:** The amount customers are willing to pay for EventGo Proof's service.

This approach allows the team to estimate the serviceable market based on identifiable customer groups, actual campaign volume, and willingness to pay, rather than applying an arbitrary percentage to the broader Event Management Software market.

### 4.4. SOM – SERVICEABLE OBTAINABLE MARKET

#### 4.4.1. Definition of SOM

**SOM (Serviceable Obtainable Market)** represents the portion of the serviceable market that EventGo Proof can realistically reach and convert into paying customers during its initial market-entry period. SOM therefore reflects the startup's realistic customer acquisition and revenue potential, rather than the total demand within the serviceable market.

#### 4.4.2. Target Market During the First 12 Months

During its first 12 months, EventGo Proof plans to focus on:

- Event organizing committees in Hanoi and Ho Chi Minh City;
- Event organizing agencies;
- Activation agencies;
- Organizations managing multiple booths or locations;
- Customers that require implementation inspection and acceptance supported by photographic evidence.

The planned customer acquisition process is:

**Access → Demo → Pilot → Performance Measurement → Payment → Purchase**

A pilot program enables EventGo Proof to validate key assumptions, including actual customer demand, usability, pricing, willingness to pay, and the potential for repeat purchases.

#### 4.4.3. SOM Calculation Method

EventGo Proof uses the following framework to estimate its potential obtainable market:

**SOM = Reachable Customers × Trial Acceptance Rate × Paid Conversion Rate × Expected Revenue per Customer**

These assumptions will be refined based on actual customer acquisition, pilot-program results, and sales data. As the product is currently in the market validation stage, EventGo Proof does not treat SOM as a confirmed market figure. Instead, SOM represents an initial target that must be validated through real customer interactions and sales performance. The previously proposed figure of 25–50 customers is therefore treated as a target rather than a statistically supported market estimate.

#### 4.4.4. Illustrative Revenue Scenario

During the MVP phase, EventGo Proof plans to test a per-campaign pricing model, with an indicative price range of approximately VND 1–3 million per campaign. This pricing range

represents an assumption for testing willingness to pay and should not yet be considered the confirmed market price.

For illustration, assuming an average fee of VND 1.5 million per campaign:

| Metric | Assumption |
|---|---|
| Average fee per campaign | VND 1.5 million |
| Average campaigns per customer per year | 6 |
| Estimated annual revenue per customer | VND 9 million |
| Number of paying customers | 10 |
| **Illustrative annual revenue** | **VND 90 million** |

**Note:** This is an illustrative revenue scenario, not an official SOM figure. The assumptions should be replaced with data collected from pilot programs and actual sales activities.

### 4.5. SYNTHESIS OF TAM – SAM – SOM

#### 4.5.1. Summary Table

| Market Level | Scope | Scale / Methodology |
|---|---|---|
| **TAM** | Global Event Management Software market | **USD 7.2 billion (2025)** |
| **Vietnam Market Reference** | Vietnam Event Management Software market | **USD 28.57 million (2025)** |
| **SAM in Practice** | Vietnamese organizations requiring multi-location booth/activation implementation control and acceptance | **Bottom-up market sizing** |

| | | |
|---|---|---|
| **SOM** | Customers EventGo Proof can realistically reach and convert during the first 12 months | **Bottom-up approach + pilot data** |

***Source:*** *IMARC Group – Global Event Management Software Market; Vietnam Event Management Software Market.*

#### 4.5.2. Relationship Between TAM, SAM, and SOM

The market structure for EventGo Proof can be illustrated as follows:

- **TAM:** Global Event Management Software Market: USD 7.2 billion. Vietnam Event Management Software Market: USD 28.57 million.
- **SAM in Practice:** Vietnamese event organizing committees and agencies requiring multi-location booth/activation implementation control and acceptance
- **SOM:** The portion of the target customer base that EventGo Proof can realistically reach and convert during its first 12 months

This segmentation approach prevents the overall Event Management Software market from being treated as EventGo Proof's directly addressable market. Instead, it distinguishes between the overall industry opportunity, the serviceable market, and the realistically obtainable customer base.

### 4.6. CONCLUSION ON MARKET SIZE

#### 4.6.1. Market Opportunity

The Event Management Software market is growing alongside the broader digitalization of event organization and management. In Vietnam, the market was valued at USD 28.57 million in 2025, providing a broader market context for the development of specialized SaaS solutions for the events industry.

However, EventGo Proof does not seek to compete by developing a comprehensive event management platform. Instead, the product focuses on a specific operational problem:

**“How can an organizing committee verify that booths across multiple locations have been implemented correctly and that sufficient evidence has been collected for acceptance?”**

To address this problem, EventGo Proof provides an operational workflow:

**Set Requirements → Create Checklist → Assign Tasks → Capture Evidence → Review → Request Revision → Approve → Generate Report**

#### 4.6.2. Market Entry Strategy

EventGo Proof follows a "Narrow First – Expand Later" strategy.

**Phase 1:**

Focus on event organizing committees and agencies that require booth acceptance and multi-location activation monitoring.

**Phase 2:**

Validate willingness to pay, time-saving benefits, operational effectiveness, and customer repeat-purchase potential.

**Phase 3:**

Expand into additional event types and broader implementation-control functions.

Therefore, during the initial phase, EventGo Proof's success should not be assessed by its share of the overall TAM. Instead, the initial objective is to validate three core indicators:

**Real Customers → Paying Customers → Repeat Customers**

This approach is consistent with the project's market-validation direction: before expanding into a broader event management platform, EventGo Proof should first demonstrate that it solves a specific operational problem, generates sufficient customer value, and has potential for repeat use.

**Sources Used in the Report**

- IMARC Group – *Global Event Management Software Market*, 2025–2034.
- IMARC Group – *Vietnam Event Management Software Market*, 2025–2034.
- IMARC Group – *Vietnam MICE Market*, 2025–2034.

**5. Scale-up Ability**

## III. Preliminary proposed product

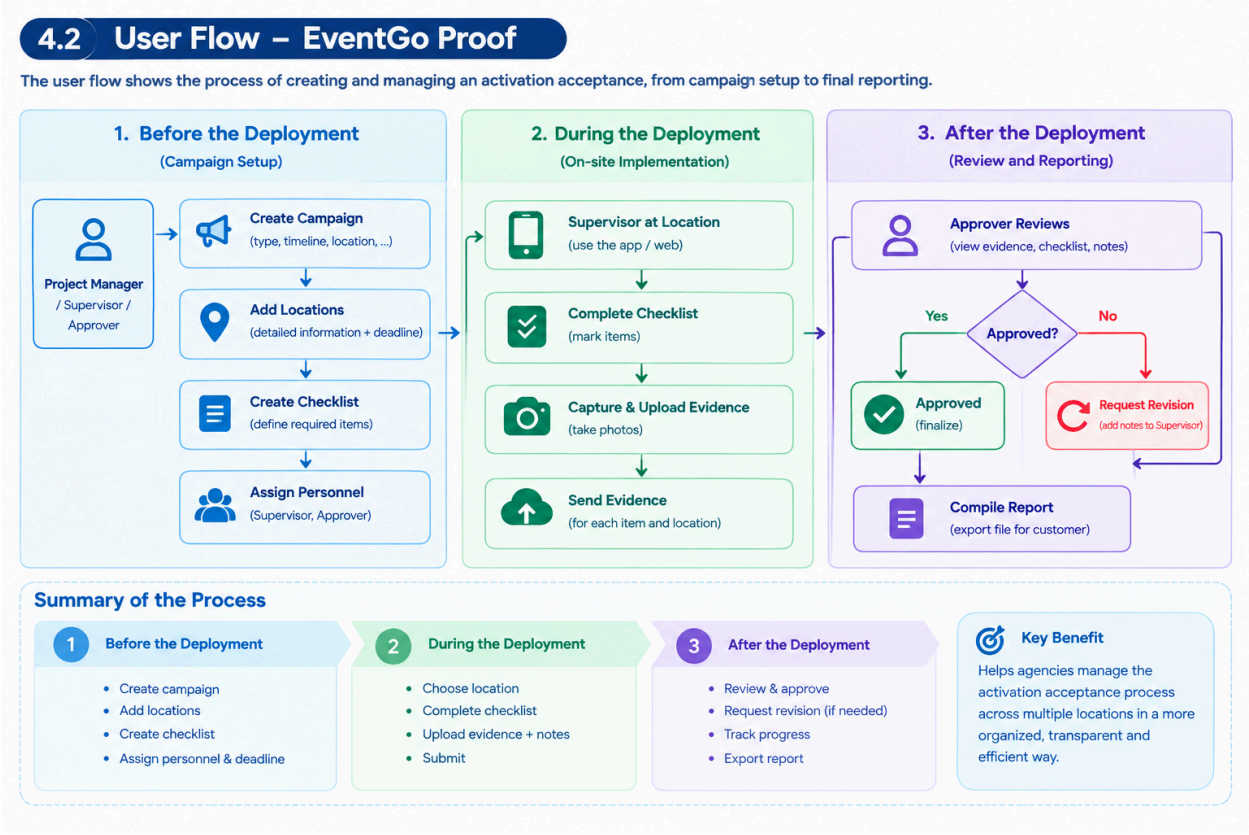

### 4.1. Product Introduction

EventGo Proof is a platform that supports agencies in managing the acceptance of multi-location activations. The product focuses on checklist management, evidence collection, approval, and report generation.

Main product workflow:

**Create campaign -> Assign -> Checklist -> Submit evidence -> Approve -> Request revision -> Complete -> Report.**

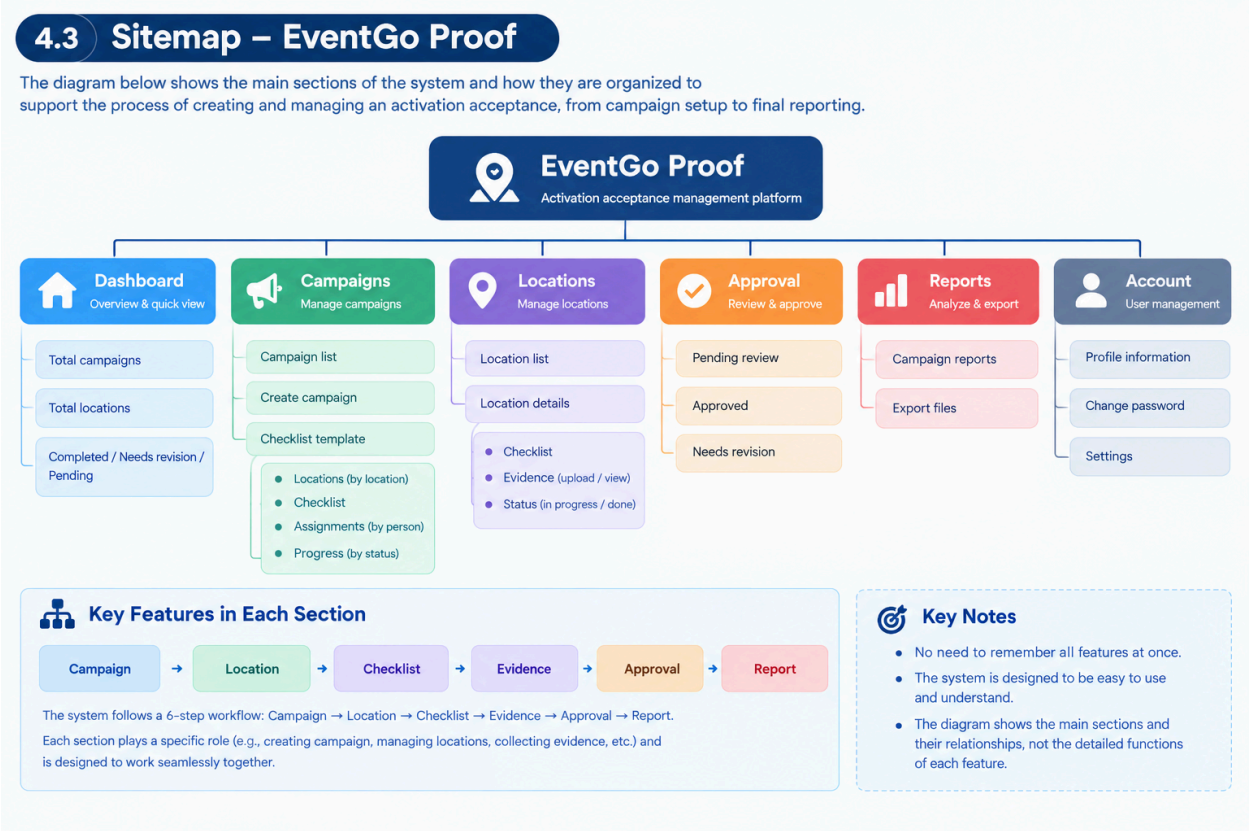

**4.2.UserFlow**

The process from creating a campaign to reporting helps agencies manage multi-location activation acceptance with ease.

1. **Pre-implementation (Campaign preparation):** Login -> Create Campaign -> Add locations -> Create Checklist -> Assign personnel.
2. **During implementation (Evidence collection):** Supervisor at location -> Check Checklist -> Take photos + add notes -> Submit evidence.
3. **Post-implementation (Approval and reporting):** Approver checks -> Approved / Request revision -> Export report.

### 4.3. Sitemap

Structure of main system functions, focusing on the multi-location activation acceptance process.

- **Main modules:** Dashboard, Campaigns, Locations, Approval, Reports, Account.
- **Core MVP functions focus on 6 steps:** Campaign -> Location -> Checklist -> Evidence -> Approval -> Report.

### 4.4. Expected Main Interfaces

- **Dashboard:** Overview of Campaigns, Locations, completed locations, pending revisions, and pending approvals.
- **Campaign Detail:** List of locations in a Campaign with status Approved, Need Revision, or Pending.
- **Checklist:** Supervisor views requirements at the location, marks items, and prepares evidence.
- **Upload Evidence:** Supervisor takes or uploads photos, adds notes, and submits evidence for each item.

- **Approval:** Approver checks evidence, selects Approve or Need Revision, and adds notes if revision is needed.
- **Report:** Summarizes the number of locations, status of each item, and allows report export.

**4.5. Pre - During - Post Implementation Process**

**Pre-implementation**

Create Campaign, enter locations, create Checklist, assign PIC and deadline.

- EventGo Proof supports: Prepare and manage all requirements for each location.

**During implementation**

Supervisor arrives at the location, executes Checklist, takes photos, and adds notes.

- EventGo Proof supports: Collect evidence for each item and location.

**Post-implementation**

Manager/Approver checks, requests revision if needed, and compiles records.

- EventGo Proof supports: Approve, save history, track missing items, and export reports.

**4.6. Reference Products and Differences: LASSO**

The team referenced event and campaign management platforms like LASSO to understand how to organize information, manage tasks, and track progress on a centralized platform. Based on the actual needs of agencies when deploying multi-location activations, EventGo Proof focuses on a specific process: acceptance and result verification.

The core of EventGo Proof is connecting the entire process: Campaign -> Location -> Checklist -> Evidence -> Approval -> Report.

- **Campaign:** Manage each campaign.
- **Location:** Manage deployment locations.
- **Checklist:** Determine items for acceptance.
- **Evidence:** Collect images and notes as evidence.
- **Approval:** Check, approve, or request revision.
- **Report:** Summarize results and export report.

By focusing on a specific process, EventGo Proof aims to help agencies reduce compilation time, limit missing evidence, and make the acceptance process with clients more convenient

## IV. Conclusion

- Key Takeaways
- Future Development Direction
